It helps reduce mistakes and improves team work.	Taking responsibility for assigned task and being honest about progress or mistakes. A responsible employee ensure that commitments are completed properly.	Being comfortable with changes and technology, processes ,teams or responsibilities. Adaptability helps freshers adjust quickly to a corporate environment

NEW TECHNOLOGY:

DETECTING A POTHOLE IN A REAL TIME SITUATION?

- A LIDAR based pothole detection system can be used along with a normal camera to provide accurate information about road condition. The camera uses AI/Computer vision to identify potholes, while LIDAR sends laser pulse toward the road and majors the reflects the signals to generate 3D depth information. This allow the system to determine the pothole's distance from the vehicles, depth, width and approximate size.
- The combination of Camera + LIDAR + AI provides a more reliable solution than using normal camera alone. The camera is expensive for recognizing and classifying the potholes, while LIDAR provides accurate measurements of its physical dimension and position. This information can be used to determine the severity of the pothole and warn the driver in advance, improving vehicle safety and road – condition monitoring.

THANK YOU
